

ABSTRACT

A pill dispenser for use with a conventional pill bottle includes a hollow housing having an upper end with an internally threaded collar thereon for coupling the housing with the externally threaded neck of a conventional pill bottle. A tubular passageway extends from the upper end of the housing to the lower end. A spring-biased reciprocal plunger extends from a side of the housing that operates a gear actuated dispensing arm that pivots into and out of the passageway. By reciprocating the plunger, a user can individually dispense a pill through the lower end of the housing.
